

Abu Fashion Store

Video Demonstration Script

Duration: 3-5 minutes

Student Name: [Your Name]

Student ID: [Your Student ID]

Application: Abu Fashion Store

Recording Device: Android emulator or physical Android device

Recording Notes

- Record the phone screen while the app is running from Android Studio, Flutter, or an installed APK.
- Speak slowly and clearly. Keep the demonstration between 3 and 5 minutes.
- Before recording, prepare a test email, password, and a few products in the cart.
- If Firebase Console is shown, hide private keys and sensitive project credentials.

Main Video Script

0:00-0:20 - Student Introduction

What to show: Show yourself briefly or show a title slide with the app name.

Voice script: Hello, my name is [Your Name], student ID [Your Student ID]. Today I am demonstrating my mobile application called Abu Fashion Store. This is an online fashion shopping app developed using Flutter and Firebase. In this video, I will show registration, login, product browsing, cart and checkout, order history, Firebase integration, and the app running on a device or emulator.

0:20-0:45 - Application Overview

What to show: Open the app on the Android emulator or physical phone. Show the login screen and app logo.

Voice script: This is the Abu Fashion Store application. The purpose of the app is to let customers browse fashion products, add items to a cart, place an order, and view past orders. The app includes categories for men, women, kids, and accessories. It uses a clean mobile interface with product images, category filters, and simple navigation.

0:45-1:25 - Login and Register

What to show: Show the sign up screen, enter sample details, then show the login screen. Use test account data.

Voice script: First, I will demonstrate the registration and login process. On the sign up screen, the user enters full name, email address, phone number, password, and confirm password. The app validates the fields before creating an account. After registration, the user can log in using email and password. Firebase Authentication is used to manage user accounts. There is also a forgot password option that sends a

reset email to the user.

1:25-2:10 - Product Browsing

What to show: Navigate to the home screen and product screen. Tap category filters and use the search bar.

Voice script: After login, the user reaches the home screen. Here we can see a welcome message, search option, category buttons, and featured products. If I open the products page, I can browse all products in a grid layout. The user can filter products by category such as men, women, kids, and accessories. The search bar helps find products quickly by name or category. Product images are loaded from network URLs and displayed in product cards.

2:10-2:50 - Product Detail and Cart

What to show: Open a product, select a size, add it to the cart, and update quantity.

Voice script: When a product is selected, the detail screen shows the product image, name, price, rating, description, and available sizes. The user must select a size before adding the item to the cart. After adding the item, the cart screen shows the selected product, size, quantity, and price. The user can increase quantity, decrease quantity, remove items, and view subtotal, shipping, and total amount.

2:50-3:30 - Cart and Checkout

What to show: Open checkout, fill delivery details, select payment method, and place order.

Voice script: Next, I will demonstrate checkout. The checkout page collects delivery information such as name, phone number, address, city, and ZIP code. It also allows the user to choose a payment method, such as credit or debit card, or cash on delivery. The order summary displays subtotal, shipping, and total. When I tap Place Order, the app creates an order and stores it in Firestore under the current user account.

3:30-4:00 - Order History

What to show: Show the order success page, then open Profile and Order History.

Voice script: After the order is placed, the confirmation screen displays the order number, order date, estimated delivery date, payment method, delivery details, and total paid. The cart is cleared after a successful order. From the profile page, the user can open order history and view previous orders. Each order card shows the order number, date, status, total amount, payment method, item count, delivery details, and ordered items.

4:00-4:35 - Firebase Integration

What to show: Show Firebase files, Firestore rules, or Firebase Console if available. Hide private credentials.

Voice script: This app is integrated with Firebase. Firebase Authentication handles registration, login, logout, password reset, and account deletion. Cloud Firestore stores user profiles, product data, and orders. The products collection is readable by users, while user profiles and orders are protected so only the account owner can access them. The app also has a local product catalog as a fallback if Firestore is not available.

4:35-4:55 - Run on Device or Emulator

What to show: Show the running app on the emulator or phone, or show the Android run target.

Voice script: The application is running on an Android emulator or physical Android device. I also built a release APK for testing and installation. This shows that the Flutter project can be compiled and executed as a real mobile application.

4:55-5:00 - Closing

What to show: Return to the home screen or title screen.

Voice script: In conclusion, Abu Fashion Store demonstrates a complete mobile shopping workflow with authentication, product browsing, cart, checkout, order history, and Firebase backend support. Thank you for watching my demonstration.

Video Checklist

- Student introduction included.
- Application overview shown from the running app.
- Login and register screens demonstrated.
- Product browsing, search, and category filtering demonstrated.
- Cart, quantity controls, checkout form, and payment method shown.
- Order confirmation and order history shown.
- Firebase Authentication and Cloud Firestore integration explained.
- App shown running on an Android emulator or physical device.
- Final video duration kept between 3 and 5 minutes.

Short Backup Script

Hello, my name is [Your Name], and this is my Abu Fashion Store mobile application. It is an online fashion shopping app built with Flutter and Firebase. Users can register, log in, browse products by category, search products, view product details, select a size, add products to the cart, and complete checkout. The checkout process collects delivery details and payment method, then stores the order in Cloud Firestore. After placing an order, the app shows an order confirmation page and the order can be viewed later in the order history screen. Firebase Authentication manages user accounts, while Firestore stores users, products, and orders with security rules to protect customer data. The app is running on an Android emulator or device, and a release APK has been built for installation and testing. Thank you.
